CALIFORNIA PROPOSITION 65 WARNING: Diesel engine exhaust and some of its constituents are known to the state of California to cause cancer, birth defects, and other reproductive harm.

CALIFORNIA PROPOSITION 65 WARNING: This product contains or emits chemicals known to the state of California to cause cancer, birth defects, and other reproductive harm.
Introduction

This manual provides information and procedures to safely operate and maintain the Generac Mobile Products unit. For your own safety and protection from physical injury, carefully read, understand, and observe the safety instructions described in this manual. Keep a copy of this manual with the unit at all times. Additional copies are available from Generac Mobile Products, or can be found at www.generacmobile.com. The information contained in this manual was based on machines in production at the time of publication. Generac Mobile Products reserves the right to change any portion of this information without notice.

Read all of the manuals included with the unit. Each manual details specific information regarding items such as setup, use and service requirements. An engine operator’s manual provides detailed operation and maintenance procedures for the engine. Additional copies of the engine operator’s manual are available from the engine manufacturer.

DO NOT MODIFY or use this equipment for any application other than for which it was designed.

Generac Mobile Products recommends that a trained and licensed professional perform all electrical wiring and testing functions. Any wiring should be in compliance with the National Electrical Code (NEC), state and local regulations and Occupational Safety and Health Association (OSHA) guidelines.

GENERAC MOBILE PRODUCTS LLC
215 Power Drive • Berlin, WI 54923
U.S.A.
Phone: 920-361-4442
FAX: 920-361-4416

SAFETY NOTES

This is the safety alert symbol. It is used to alert you to potential personal injury hazards. Obey all safety messages that follow this symbol to avoid possible injury or death.

This manual contains DANGERS, WARNINGS, CAUTIONS, NOTICES and NOTES which must be followed to prevent the possibility of improper service, damage to the equipment, personal injury or death. The following formatting options will apply when calling the readers attention to the DANGERS, WARNINGS, CAUTIONS, NOTICES and NOTES.

⚠️ DANGER

INDICATES A HAZARDOUS SITUATION WHICH, IF NOT AVOIDED, WILL RESULT IN DEATH OR SERIOUS INJURY.

⚠️ WARNING

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

⚠️ CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE

Indicates a hazardous situation which, if not avoided, could result in property or equipment damage.

Note: Notes contain additional information important to a procedure and will be found within the regular text body of this manual.

OPERATING SAFETY

Before using the unit be sure you read and understand all of the instructions. This equipment was designed for specific applications; DO NOT modify or use this equipment for any application other than which it was designed for. Equipment operated improperly or by untrained personnel can be dangerous. Read the operating instructions and familiarize yourself with the location and proper use of all instruments and controls. Inexperienced operators should receive instruction from someone familiar with the equipment before being allowed to operate or set up the generator. The following points should be practiced at all times:

- The area immediately surrounding the unit should be dry, clean, and free of debris.
- Position and operate unit on a firm, level surface.
- NEVER start a unit in need of repair.
- NEVER modify the unit or use it in a manner other than what it was designed.
- DO NOT start the unit if any panels or guards are loose or missing.
- Turn the Key switch to the OFF position when servicing or troubleshooting.
- Use hearing protection if you will be near an operating unit for an extended period of time.
- Keep clear of pump suction and discharge openings while engine is running.
- Keep all body parts, loose clothing and any other obstructions away from moving parts.
- NEVER operate a unit while tired, distracted, or under the influence of drugs or alcohol.
**ENGINE SAFETY**

Internal combustion engines present special hazards during operation and fueling. Failure to follow the safety guidelines described below could result in severe injury or death. Read and follow all safety warnings described in the engine operator's manual. A copy of this manual was supplied with the unit when it was shipped from the factory.

- **DO NOT** run engine indoors or in an area with poor ventilation. Engine exhaust contains carbon monoxide, a deadly, odorless and colorless gas which, if inhaled, can cause nausea, fainting, or death. Only use this unit outside and away from windows, doors, and ventilation equipment.
- **DO NOT** smoke around unit. Ensure that no combustible materials are left on or near unit, as FIRE or EXPLOSION may result.
- **DO NOT** touch or lean against hot exhaust pipes or engine block.
- **DO NOT** clean air filter with gasoline or other types of low flash point solvents.
- **DO NOT** remove engine coolant cap while engine is hot.
- **DO NOT** operate the unit without a functional exhaust system.
- Prolonged exposure to sound levels in excess of 85 dB(A) can cause permanent hearing loss. Wear hearing protection when working around a running engine.
- Keep hands, feet and loose clothing away from moving parts on the generator and engine.
- Keep area around exhaust pipes and air ducts free of debris to reduce the chance of an accidental fire.
- Batteries contain sulfuric acid which can cause severe injury or death. Sulfuric acid can cause eye damage, burn flesh or eat holes in clothing. Protective eye wear and clothing are necessary when working on or around the battery. Always disconnect the negative (-) battery cable from the corresponding terminal before performing any service on the engine or other components.

**PUMP SAFETY**

Centrifugal pumps are designed for specific applications and may not be suited for other uses without loss of performance or potential damage to equipment/personnel. If there is any doubt about suitability for a specific purpose, contact Generac Mobile Products for assistance. Follow the safety guidelines described below to prevent hazardous situations which could result in severe injury or death.

- The pump is designed to handle mild industrial corrosives, residues, and slurries containing some large entrained solids. Do not attempt to pump volatile, corrosive, or flammable materials that may damage the pump or endanger personnel as a result of pump failure.
- After the pump has been positioned, make certain that the pump and all hose/piping connections are tight, properly supported and secure before operation.
- **DO NOT** operate the pump without the guards in place over the rotating parts. Exposed rotating parts can catch clothing, fingers, or tools, causing severe injury.
- **DO NOT** remove plates, covers, gauges, pipe plugs, or fittings from an overheated pump. Vapor pressure within the pump can cause parts being disengaged to be ejected with great force. Allow the pump to cool before servicing.
- **DO NOT** operate the pump against a closed discharge valve for long periods of time. If operated against a closed discharge valve, pump components will deteriorate, and the liquid could come to a boil, build pressure, and cause the pump casing to rupture or explode.
- Remove suction and discharge hoses/piping from pump prior to moving. Use lifting and moving equipment with adequate capacity and in good repair.
- **NEVER** exceed the maximum permissible operating pressure of the pump as shown on the pump performance curve.
- **NEVER** wash the unit with a high pressure hose or with any kind of power washer.
• NEVER wash the engine block or fuel tank with a power washer or steam cleaner. Water may collect in the pump control panel or other electrical parts, causing damage.

• If equipment is stored more than 12 months, some of the components or lubricants may have exceeded their maximum shelf life. These must be inspected and replaced as necessary prior to pump operation to ensure proper pump performance.

SERVICE SAFETY

All service work must be performed by qualified personnel who are familiar with the equipment. Only a qualified electrician should troubleshoot or repair electrical problems occurring in this equipment. Follow the safety guidelines described below to prevent hazardous situations which could result in severe injury or death.

• Before servicing the unit, make sure the Key switch is turned to OFF and the negative terminal on the battery is disconnected. NEVER perform even routine service (oil/filter changes, cleaning, etc.) unless all electrical components are shut down.

• NEVER service electrical components if clothing or skin is wet. If the unit is stored outside, check the engine for any moisture and dry the unit before use.

• NEVER open the radiator cap or oil drain plug while the engine is running or before the engine has cooled down. Pressurized coolant and hot engine oil can cause severe burns. Allow the engine and pump to cool completely before attempting any service work.

• Check the temperature before opening any pump covers, plates or plugs. Allow the pump to cool if overheated.

• Before servicing the pump end, close the suction and discharge valves. Vent the pump slowly and cautiously. Drain the pump completely.

• NEVER attempt to modify the engine, pump or related components.

• Replace all guards and safety devices immediately after servicing.

• Replace all missing and hard to read labels. Labels provide important operating instructions and warn of dangers and hazards.

• Make sure slings, chains, hooks, ramps, jacks, and other types of lifting devices are attached securely and have enough weight-bearing capacity to lift or hold the equipment safely. Always remain aware of the position of other people around you when lifting the equipment.

TOWING SAFETY

Towing a trailer requires care. Both the trailer and vehicle must be in good condition and securely fastened to each other to reduce the possibility of an accident. Also, some states require that large trailers be registered and licensed. Contact your local Department of Transportation office to check on license requirements for your particular unit.

• Check that the hitch and coupling on the towing vehicle are rated equal to, or greater than, the trailer’s Gross Vehicle Weight Rating (GVWR).

• Check tires on trailer for tread wear, inflation, and condition.

• NEVER tow trailer using defective parts. Inspect the hitch and coupling for wear or damage.

• Make sure the trailer hitch and the coupling are compatible. Make sure the coupling is securely fastened to the vehicle.

• Connect safety chains in a crossing pattern under the tongue and ATTACH THE BREAKAWAY CABLE TO THE REAR BUMPER OF THE TOWING VEHICLE. Do not attach the cable to the trailer hitch.

• Make sure directional and brake lights on the trailer are connected and working properly.
Safety

- Check that lug nuts holding wheels are tight and that none are missing.
- Maximum recommended speed for highway towing is 45 mph (72 km/h). Recommended off-road towing speed is not to exceed 10 mph (16 km/h) or less, depending on terrain.

Before towing the trailer, check that the weight of the trailer is evenly distributed. A large angle between the trailer and tow vehicle will cause more weight to be carried by the trailer axle, which could cause premature wear on the tires and axle and cause potentially unsafe operating conditions.

The trailer is equipped with surge brakes. Check the operation of the brakes by braking the vehicle at a slow speed before entering traffic. Both the trailer and the vehicle should brake smoothly. If the trailer seems to be pushing, check the level in the brake fluid reservoir.

When towing, maintain extra space between vehicles and avoid soft shoulders, curbs and sudden lane changes. If you have not pulled a trailer before, practice turning, stopping and backing up in an area away from heavy traffic.

A film of grease on the coupler will extend coupler life and eliminate squeaking. Wipe the coupler clean and apply fresh grease each time the trailer is towed.

REPORTING TRAILER SAFETY DEFECTS

If you believe your trailer has a defect which could cause a crash or could cause injury or death, you should immediately inform the National Highway Traffic Safety Administration (NHTSA) in addition to notifying Generac Mobile Products.

If NHTSA receives similar complaints, it may open an investigation; and if it finds that a safety defect exists in a group of vehicles, it may order a recall and remedy campaign. However, NHTSA cannot become involved in an individual problem between you, your dealer, or Generac Mobile Products.

To contact NHTSA, you may either call the Auto Safety Hotline toll-free at 1-888-327-4236 (TTY:1-800-424-9153), go to http://www.safercar.gov; or write to:

Administrator
NHTSA
1200 New Jersey Avenue S.E.
Washington, DC 20590

You can also obtain other information about motor vehicle safety from http://www.safercar.gov.
SAFETY SYMBOL SUMMARY

This equipment has been supplied with numerous safety and operating decals. These decals provide important operating instructions and warn of dangers and hazards. Replace any missing or hard-to-read decals and use care when washing or cleaning the unit. Decal placement and part numbers can be found in the online parts manual at www.generacmobile.com. Below is a summary of the intended meanings for the symbols used on the decals.

UNIT SERIAL NUMBER LOCATIONS

Refer to the illustration to locate the unit ID tag and Vehicle Identification Number (VIN) tag on the unit. Important information, such as the unit serial number, model number, VIN and tire loading information are found on these tags. Record the information from these tags so it is available if the tags are lost or damaged. When ordering parts or requesting assistance, you may be asked to provide this information.

LOWERERING THE TRAILER TONGUE

For units shipped with the trailer tongue in the upright position, follow the steps below to lower the tongue.

1. Elevate the unit using a hoist or forklift, or use the jack located on the trailer tongue.

*Note:* *If using the front jack for support, it must first be moved to the jack mount location nearest the frame.*

2. Remove the mounting hardware securing the tongue shipping brace to the trailer frame. Refer to #1 in *Figure 5.*

![Figure 5 - Removing the Shipping Brace](image)

3. Remove the shipping brace and slide it into the trailer tube opening. Secure the brace to the trailer with the bolt located on the underside of the trailer and a new nylon locking nut. Refer to #2 in *Figure 5.*

4. Flip the trailer tongue down and reinstall the bolts and washers removed in step 2 using two new nylon locking nuts. **DO NOT** reuse nylon locking nuts. Tighten the bolts to 80-109 ft-lbs (108-148 Nm).

![Figure 6 - Reinstall Hardware](image)

*Note:* *If the jack was used to support the unit while removing the shipping brace, the jack must be moved back to the tongue location before the unit can be towed.*

1. Connect the trailer tongue to a vehicle or other support and move the jack to the tongue location.

2. Tighten the bolt inside the jack mounting tube nearest the frame.
DIGITAL CONTROLLER

The CANplus® 750 (CP750™) controller is a universal platform to monitor, control and automatically start/stop both electronically and mechanically governed diesel engines. The microprocessor-based, solid-state design uses high power semiconductors instead of electromechanical relays to ensure reliable high current switching. Graphical gauge pages or a single large analog gauge are displayed on the 4.25 in. (10.79 cm) diagonal Liquid Crystal Display (LCD). Virtually any SAE J1939 parameter reported by the Engine Control Unit (ECU) can be displayed, including Revolutions Per Minute (RPM), coolant temperature, oil pressure, engine hours, voltage and diagnostic codes. The trans-reflective, backlit display is clearly readable in both bright sunlight and total darkness and is housed in a rugged IP67-rated housing.

Current alarm conditions are displayed in plain language on pop-up messages and can be viewed in the alarm list. Various diagnostic screens allow detailed investigation of the CANbus data stream. By accessing the Configuration menu, users can customize displayed data to show metric or US units, display language and various other parameters such as the full-scale reading of gauges. Four bright Light Emitting Diodes (LEDs) below the display indicate Auto Standby, Preheat, Stop and Warning status.

Five buttons access a context dependent button bar when any button from 1 to 4 is pressed. The graphical menu structure uses icons to indicate the button’s current function. After five seconds of inactivity, the button bar disappears.

<table>

</tr>
</tbody>
</table>

Press repeatedly to cycle through four pages of analog gauges (16 total).

Press repeatedly to cycle through four pages of digital gauges (16 total).

Press repeatedly to cycle through available analog gauges.

Displays active alarms with a plain language description.

Configures the parameters displayed by gauge pages.

Note: Most problems with electronically controlled engines can be pinpointed via ECU diagnostic messages. Use the display or ECU diagnostic tool to view fault codes. Engine state information and diagnostic codes displayed by the CANplus display are provided via the CANbus.
General Information

Automatic Operation
The CP750™ panel features advanced automatic start/stop controls which can meet almost any requirement. Two switch inputs and a transducer input support a number of control scenarios. Single switch mode allows reliable operation with a single switch. Dual switch operation allows greater hysteresis when needed.

The transducer input supports simple start/stop operation by level or pressure and maintenance modes with speed modification.

- Programmable high and low set points control start/stop operation.
- Level maintenance modes monitor the operating point and adjust the engine speed to match the targeted set point with configurable aggressiveness.
- Dual switch inputs can be combined with the transducer input for redundant safety to protect against transducer sensor clog or failure.

Throttle Control
The standard ramp throttle uses a momentary rocker switch to adjust the integral throttle control. All throttle commands are sent directly to the engine using CANbus throttle control.

Service Timers
The CP750™ display provides 16 service timers to alert the operator of needed maintenance. The time interval for each timer can be adjusted in 10 hour increments. A pop-up message is displayed after the display self test if a timer has expired, alerting the user that service is required. The message is displayed on each power up until the elapsed timer is disabled or reset.

CANplus Messenger Telemetry Option
The optional CANplus Messenger system provides a variety of features to protect and support the equipment investment. Remote monitoring can alert maintenance requirements, operational problems, improper operation and location with geo-fence alert. The web-browser interface allows monitoring an entire fleet of equipment in a central location. Contact Generac Mobile Products for more information.

Button Lock
The controller’s five buttons can be locked so the operator does not accidentally change settings or access another display mode. Button Lock is enabled by pressing and holding buttons 1 and 5 simultaneously for one second. Repeating this operation restores normal button operation.
CONTROL PANEL OPERATION

Turning the Key switch to the RUN position energizes the ECU, all LEDs illuminate once and a startup screen is displayed while a self test is performed. If the display beeps for longer than one second, it indicates a self test fault. Users can attempt to rectify the fault by restoring factory defaults. Refer to the Configuration menu for details.

Refer to the Troubleshooting section on page 61 for fault troubleshooting information. Contact Generac Mobile Products for assistance if the fault persists.

After the startup screen is cleared, the display shows readings on its virtual gauges. Initially the analog gauges are displayed, but the display uses the last displayed screen on subsequent startups. Refer to “Preferred Screen Store” for details.

If the ECU is preheating when the Key switch is turned to the RUN position, the Preheat LED is illuminated. Preheat time varies with atmospheric and engine conditions. After waiting for the Preheat LED to extinguish, the engine is cranked by turning and holding the Key switch in the START position until the engine starts.

Note: The ECU will not preheat unless conditions warrant. If necessary, starting the engine may be attempted by turning the key to the START position without waiting for preheat to expire. The Key switch is spring loaded to return automatically to the RUN position when released. The Key switch includes an interlock to prevent the key from being turned to the START position while the engine is running. The Key switch must be turned to the OFF position to reset the starter interlock before the switch can be turned to the START position again.

THROTTLE CONTROL

The type of throttle operators installed, along with the configured values of minimum requested RPM, idle RPM, intermediate RPM, run RPM and maximum requested RPM, determine throttle operation. The engine speed can be adjusted above run RPM and below idle RPM, but the requests can not fall below the set minimum requested RPM or above the set maximum requested RPM. The ECU determines how the engine responds to the throttle requests and will not allow the engine speed to fall below the ECU minimum or exceed the maximum RPM.

Note: To change the minimum requested RPM and maximum requested RPM settings, contact Generac Mobile Products.

RAMP THROTTLE (SPEED CONTROL SWITCH)

The standard ramp throttle uses a momentary rocker switch to adjust the requested engine speed. When first started, the requested engine speed is Idle RPM. Pressing and releasing the Rabbit icon increases the speed requested by 25 RPM. Pressing and holding the Rabbit icon causes the speed to accelerate to full speed in a few seconds. Similarly, pressing the Turtle icon decreases the requested speed.
AUTOMATIC START/STOP OPERATION

The pump can be configured to start automatically by adding dry-contact closure float level switches. Ensure that the dry-contact closure float switch harness is connected to the port on the back of the control box. Contact the Generac Mobile Products Technical Service Department at 1-800-926-9768 for more information.

Turning the Key switch to the AUTO START position causes all LEDs to illuminate once the AUTO STANDBY indicator is illuminated and the startup screen is displayed while a self test is performed. After the startup screen is cleared, the display shows the transducer reading and switch status on the Transducer/Switch gauge. All other CANbus values will show since the ECU is not energized at this time. After one minute, the display is powered down to reduce battery drain. The automatic start/stop system is still functioning as indicated by the Auto Standby LED.

For electronically governed units, once the configured automatic start condition exists, the display powers up, the panel starts the engine and follows the throttle control profile configured (refer to Figure 9). The flexible throttle profile includes various speeds and times for a variety of scenarios.

When the configured stop conditions exist, the panel reduces the engine speed per the throttle profile and stops the engine. If the configured start conditions exist before the shutdown process is complete, the engine will return to the previous speed until the stop condition exists.

WARNING

When the Key switch is turned to the AUTO START position and a start condition exists, the panel will start immediately. Always configure parameters by turning the Key switch to the RUN position. DO NOT configure the panel in the AUTO START position. Always use lock out/tag out procedures when servicing autostart equipment.

Start and Stop Events

The start and stop events are determined by the combination of Start/Stop mode and function.

Start/Stop Modes:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sngl Switch</td>
<td>Switch one controls automatic operation.</td>
</tr>
<tr>
<td>Dual Switch</td>
<td>Both switch inputs control automatic operation.</td>
</tr>
<tr>
<td>Transducer</td>
<td>The transducer input controls automatic operation.</td>
</tr>
<tr>
<td>Xducer &amp; Sw</td>
<td>The transducer input controls automatic operation with dual switch mode as the backup. The switch inputs override the transducer if actuated when the transducer is not calling for an automatic cycle.</td>
</tr>
</tbody>
</table>

Start/Stop Functions:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Empty</td>
<td>Uses the selected mode to reduce the level or pressure.</td>
</tr>
<tr>
<td>Fill</td>
<td>Uses the selected mode to increase the level or pressure.</td>
</tr>
</tbody>
</table>
Maintain Out Uses the transducer to maintain the level or pressure at or below the target.

Maintain In Uses the transducer to maintain the level or pressure at or above the target.

</tbody>
</table>

Note: When the switch inputs are the source of the start event in Xducer & Sw mode, only the switches will stop the engine.

Maintain Functions

The Maintain In and Maintain Out functions adjust the engine speed to keep the transducer level at the Target Set Point. The Servo Gain adjusts how aggressively the throttle is adjusted while the Servo Delay controls how often the throttle is adjusted.

Note: Maintain functions are only available in the Transducer or Xducer & Sw modes.

The direction of the throttle adjustment is dependent on the selected mode as shown in the table.

<table>
<thead>
<tr>
<th>Transducer State</th>

<td>Decrease Speed</td>
<td>Increase Speed</td>
</tr>
</tbody>
</table>

Dead Band

In some situations, the transducer level may fluctuate around the Target Set Point. To limit throttle hunting using the maintain functions, a dead band can be programmed. This value prevents throttle adjustment while the level is within the band (refer to diagram). In essence, the speed is considered to be at the target whenever it is within the dead band.

Note: The dead band entered is the amount above and below the target point. For example, if the target is 5.0 ft (1.52 m) with a 0.1 ft (.03 m) dead band, the dead band is 4.9 to 5.1 ft (1.49 to 1.55 m).
**General Information**

**CANPLUS DISPLAY**

Soft buttons simplify the user interface by displaying a *button bar* above the buttons when any of the first four buttons (buttons 1 to 4), starting from the left) are pressed. Icons on the button bar change to represent the current function of each button. The button bar disappears after five seconds if no further buttons are pressed.

*Note:* Different software versions may have slightly different displays.

**ANALOG GAUGE PAGES**

Analog Gauge Pages provide four independent pages of analog gauges. To enable Analog Gauge Pages, press any of the first four buttons to show the top level button bar and then press button 1. Alternate pages are selected by repeated pressing of button 1. The four standard gauge pages are shown below.

*Note:* Engine Hours are displayed as a digital value even on Analog Gauge Pages. The default gauge pages represent 13 selections since the tachometer is repeated in the upper right quadrant of each page.

All 16 gauges may be configured by the user to create an application-specific view of CANbus data. Gauges on the current page can be changed via Adjust mode, accessed by pressing button 5 when the button bar is visible. Gauges can be changed on any of the four pages by selecting the page to be changed and then entering Adjust mode.

*Note:* Quad Adjust must be enabled to access the Adjust mode.

In Adjust mode, a new button bar is displayed identifying the button functions. Button 1 corresponds to the upper left gauge, button 2 to the upper right gauge, button 3 to the bottom left gauge and button 4 to the bottom right gauge. Successive presses of the buttons selects a different parameter for the gauge. Adjust mode is exited by pressing button 5 and storing the new configuration even when power is removed.

*Note:* A gauge selection can only appear once per page. To move a gauge selection, the existing gauge location must be changed first. Gauge selections are limited to the data currently being received. Analog Gauge Pages can be configured in Demo mode to select any supported parameter. Refer to Data Parameters Monitored for a complete list of available parameters.

Adjust mode can be disabled in the Configuration menu (Quad Adjust - Off) to prevent accidental changes.
DIGITAL GAUGE PAGES

Digital Gauge Pages display the same data as the Analog Gauge Pages but in digital only format. To enable Digital Gauge Pages, press any of the first four buttons to show the top level button bar and then press button 2. Alternate pages are selected by repeated pressing of button 2. The four standard Digital Gauge Pages are shown below.

Note: The 16 gauges are the same for Analog and Digital Gauge Pages. Adjustments in either Analog Gauge Pages or Digital Gauge Pages affect the same gauge in the other mode.

SINGLE ANALOG GAUGE

Single Analog Gauge uses the entire display for a single large analog gauge. This mode is enabled by pressing any of the first four buttons to show the top level button bar and then press button 3. The gauge displayed is selectable by repeatedly pressing button 3 while in the Single Analog Gauge mode while the menu bar is visible. The currently displayed gauge is stored when power is removed. Refer to Preferred Screen Store.

Note: Gauge selections are limited to the data currently being received. Refer to Data Parameters Monitored for a complete list of available parameters.

ANALOG TRANSDUCER/SWITCH GAUGE

The Analog Transducer/Switch Gauge displays the transducer value and the switch input states. The left column represents the values as a bar graph with a digital value displayed below. The right column shows whether the switches are open, represented by the pointer being down, or closed, represented by the pointer being up.

DIGITAL TRANSDUCER GAUGE

The Digital Transducer Gauge displays the transducer value as a digital only value. The switch state is not displayed on the Digital Transducer Gauge.

ACTIVE ALARMS

A flashing pop-up window is overlaid on the current screen when an active alarm is received. The pop-up includes a plain language description in addition to the standard SPN/FMI (Suspect Parameter Number/Failure Mode Indicator).
pair defined by the SAE J1939 standard. Additionally, if enabled, the beeper sounds as an audible cue.

The examples above are alarm list screens showing unacknowledged conditions and acknowledged alarms. After acknowledgment, the exit button becomes active.

Note: Standard J1939 abbreviations are used for alarms. MS = Most Severe, MOD = Moderately Severe, LS = Least Severe.

Refer to “Diagnostic Trouble Codes (DTS)” on page 63 for more information on SPN/FMI codes.

ALARM LIST

The Alarm List is accessed by pressing any button while an alarm pop-up is displayed or by pressing any of the first four buttons to show the button bar and then button 4 . Alarms not yet acknowledged are shown in gray on black while acknowledged alarms are shown in black on gray. The list also indicates when the alarm occurred if engine hours are available. The most recent alarm is displayed at the top of the list. The list can be scrolled using buttons 1 and 2 and alarms acknowledged by pressing button 3 . The Alarm List can be closed by pressing button 5 once the alarms are acknowledged.

An alarm indicator is displayed near the upper right corner of the display as long as alarms are active. The indicator and alarm messages in the list are automatically removed when the alarm is no longer received for a few seconds.

Note: Only active faults are displayed in the alarm list. Once a fault is corrected, it is automatically removed from the list. To view previously active faults, use the engine diagnostic tool.

CONFIGURATION

To adapt the CP750™ panel to the requirements of a particular application, a large number of parameters are configurable. The most commonly modified parameters can be accessed by invoking the Configuration menu of the display. Infrequently changed parameters and those parameters that typically need to be restricted, such as Maximum RPM, are accessible only through the CANplus Configuration. The CANplus Configurator is a Windows® PC program and a hardware adapter that allows total access to the parameters of the panel. For more information about the CANplus Configurator, please contact Generac Mobile Products.

CONFIGURATION MENU

The Configuration menu allows the user to set various operating parameters such as US or Metric units, scale limits for tachometer and service timers. The Configuration menu is entered by pressing and holding button 5 (the right hand button) in any mode for at least three seconds. If PIN (Personal Identification Number or ‘password’) entry is enabled the correct PIN must be entered to access the Configuration menu. The top level Configuration menu is displayed as shown. Buttons 1 and 2 allow you to choose from Display, System, Autostart, Settings, Telemetry or Db Viewer. Pressing button 4 selects the chosen menu item indicated by bold text and the selection arrow. Each item is described in detail on the following pages. Settings are automatically stored when exiting the current
menu even when power is removed.

Note: Most configuration changes take affect immediately. Some, such as Idle RPM, take effect on the next power up.

**DISPLAY MENU**

The Display menu allows the user to configure items affecting how information is displayed.

---

**Units Menu**

This menu allows the user to set the units used for speed, distance, pressure, volume and temperature independently. Button 4 cycles through the available values for the selected item.

- **Speed**
  - MPH (miles per hour); km/h (kilometers per hour); Knts (knots)

- **Distance**
  - Miles; km (kilometers); NM (nautical miles)

- **Pressure**
  - PSI (pounds per square inch); bar (barometric units); kPa (kilopascals)

- **Volume**
  - Gal (US gallons); IGal (Imperial gallons); Liters

- **Temperature**
  - °F (Fahrenheit); °C (Celsius)
General Information

Language Menu
This menu allows the user to choose between English, Swedish, French, German, Spanish, Italian, Dutch and Portuguese. The currently selected value is indicated by the check mark . Button 4 selects the highlighted value.

Button Beep
The soft buttons emit an audible beep when this item is On. Button beep is disabled by setting this item to Off. The audible beep still sounds when an alarm occurs. Button 4 cycles between On and Off.

Gauges Menu
This menu allows the user to configure aspects of the gauges displayed. Button 3 selects the previous value while button 4 selects the next value of the highlighted item.

Max RPM
Sets the full scale RPM indicated by the tachometer gauge.
**RPM**
- 2500, 3000, 3500, 4000, 4500, 5000, 6000, 7000, 8000 or 9000

Max Speed
Sets the full scale speed indicated by the speedometer gauge.
**MPH**
- 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 70, 75, 80, 85, 95 or 100
**km/h**
- 20, 30, 40, 50, 60, 70, 80, 90, 100, 110, 120, 130, 140, 150 or 160

Quad Adjust
Allows the user to disable Adjust mode of the Analog and Digital Gauge Pages. Button 3 disables while button 4 enables Quad Adjust. Disabling Adjust mode locks the current gauge configuration and prevents the operator from accidentally changing the gauge configuration.

Voltmeter
Leave setting at the 12V factory default. (24V is not available on this unit.)

Service Timers
Sets the 16 service intervals in hours and resets the service timer. Setting the service interval to 0 disables the timer and the word Off is displayed.
Pressing button 4 allows adjusting the selected service timer.
Button 1 decreases the service interval time while button 2 increases the service interval time in 10 hour increments. Holding button 3 for approximately three seconds resets Next Service In to the current service interval. The service timer descriptions can be changed using the CANplus Configurator. Refer to “Adjusting the Service Timers” on page 51 for more information.
Note: It is not possible to set the service timers if engine hours are not being received by the display.

SYSTEM MENU

The System menu allows the user to configure items affecting how the system functions. Button 4 cycles through the available values for the selected item.

Demo

The display supports several demo modes to operate with simulated data. Mode 1 simulates speed data and engine parameters. Mode 2 only simulates engine parameters. Mode 3 simulates speed data, engine parameters and alarms. Mode 0 disables Demo mode. Demo is automatically set to 0 (Off) if live data is received.

Restore Defaults

This allows resetting of all configuration information to default US or Metric units. Additionally, the display is reset to the initial configuration.

The default settings are:

<table>

Com Viewer
Displays CANbus data received and engine configuration transmitted by the ECU.

J1939 Viewer
This screen provides a hexadecimal dump of the messages received on the CANbus. This viewer displays the raw data. To see the decoded data, use the Db Viewer.

Button 1 freezes the display while button 2 shows the CANbus data statistics screen.

Engine Config
This screen displays the engine configuration information received from the ECU. Button 2 selects the next page of engine configuration while button 1 selects the previous page.

<table>

J1939 Settings
This screen allows adjustments specific to the J1939 data link.

Engine Source
Selects which source the display listens to for gauge data. Every device on a J1939 network has a unique address (in the range 0-254) to which the display can choose to listen. The display listens to a single data source; usually the ECU at address 0.

Note: Incorrectly configuring the Engine Source address will result in no data available for display.

Display CAN Add
As mentioned previously, every device has a unique address and the display is no different. The default display address is 40, the recommended address for single engine setups.

Note: Incorrectly configuring the Display CAN Address can result in data collisions on the CANbus.

Alarm Filter
This setting specifies whether the display will display alarms from all sources (Glb or global) or only the source address specified in the “Engine Source” setting (Src or source).

SPN Version
Selects the default SPN (Suspect Parameter Number) conversion method version automatically.

Note: Selecting the wrong version will cause alarm data to be displayed incorrectly.

Speed Source
There are three sources of speed data the display can decode. The settings for this parameter are Auto, NMEA, Wheel, Nav and Off. Auto prioritizes the sources (highest to lowest); NMEA, Wheel (PGN 65265), Nav (PGN 65272). The selection can be forced to one of the available sources by selecting it explicitly. Selecting Off stops the display listening to any source of speed data.

PIN Settings
By default, PIN (Personal Identification Number) security is disabled. The user is prompted to enter a PIN every time the Configuration menu is accessed after this feature is enabled.

PIN Entry
This allows turning PIN Entry on or off. To enable the PIN Entry feature, select PIN Settings and press button 4 to enable. As a security feature, a default pin number must be entered. Contact Generac Mobile Products to obtain the number. Once the PIN has been entered, the feature is enabled. PIN Entry is disabled by setting PIN Entry to Off.
The digits of the PIN are entered by using the buttons corresponding to the digits of the PIN.

Button 1 \( \text{button1} \) adjusts the first digit of the PIN. Button 2 \( \text{button2} \) adjusts the second digit, button 3 \( \text{button3} \) the third digit and button 4 \( \text{button4} \) the fourth digit. The PIN is entered using button 5 \( \text{button5} \).

**PIN Change**

This allows changing the PIN. The user is prompted for the current PIN.

The user is prompted for the new PIN.

The new PIN must be confirmed before the PIN is changed.

If the new PINs match, a confirmation screen is displayed.

If the two PINs do not match, an error message is displayed and the PIN is unchanged.

⚠️ **WARNING**

If the PIN is changed from the default and the new PIN is lost, the configuration mode will not be accessible. Clearing the PIN requires returning the display to LOFA Industries Inc. for service. Contact LOFA Industries Inc. at 770-569-9828.

**About**

Displays the following product information:

**JOB**  N/A

**CONFIG**  Generac programmed controller part number

**ADAPTER**  Last adapter serial number used to program the controller

**VERS**  Software version number

**PRODUCT**  Controller model name

**RUN TIME**  Hours the unit has been run
Note: This screen can not be exited until the checksum calculation is complete. Checksum calculation takes approximately 10 seconds and is complete when the checksum value changes from “Calculating”… to a hexadecimal value such as 0x704E – OK.

AUTOSTART MENU

This submenu allows the user to configure automatic start/stop operation. Refer to “Automatic Start/Stop Operation” on page 16 for more information.

Mode

This menu selects the basic automatic start/stop operation mode. Button 4 cycles between Single Switch, Dual Switch, Transducer or Xducer & Sw.

Function

This menu selects the automatic start/stop function. Button 4 cycles between Empty, Fill, Maintain Out and Maintain In.

Throttling Menu

The throttling menu allows the user to configure throttle control. It also allows programming the automatic start/stop throttle profiles as shown in Figure 9 on page 16.

Idle RPM

Selects the RPM the control system will request for idle speed. Idle can be set to compensate for parasitic loads such as hydraulic pumps or compressors. Idle RPM is the low speed setting of the optional two state or three state throttle switches.

Note: The minimum engine speed is set by the ECU. Requesting a lower speed causes the engine to run at the ECU minimum speed. RPM limits are programmed into the panel to limit the requested speed. Contact Generac Mobile Products for information on changing the panel minimum requested RPM and maximum requested RPM.

Intermediate RPM

Selects the RPM the control system will request for intermediate speed. The intermediate speed can be used to prime pump or charge lines during automatic start/stop operation. Intermediate RPM is the middle setting of optional three state throttle switches.

Note: Setting the Intermediate RPM to the same speed as Idle RPM and Ramp to Run to zero seconds is effectively two speed automatic operation.

Run RPM

Selects the RPM the control system will request for run speed. The run speed is the normal operating speed during automatic start/stop operation. Run RPM is the high speed setting of the optional two state or three state throttle switches.
Ramp Up/Down
This submenu configures the speed profile for automatic start/stop operation.

Warm Up s
Selects the number of seconds to operate at idle speed before beginning the ramp to intermediate speed. The warm-up time begins when the starter is disengaged.

Ramp Up s
Selects the number of seconds to ramp from idle speed to intermediate speed after warm-up.

Intermediate s
Selects the number of seconds to operate at intermediate speed before ramping to run speed.

Ramp to Run s
Selects the number of seconds to ramp from intermediate speed to run speed after intermediate warm-up.

Ramp Down s
Selects the number of seconds to ramp from current speed to idle speed. The ramp down time begins when the automatic start/stop system detects a stop event.

Cool Down m
Selects the number of minutes to operate at idle speed after ramp down time. At the end of the cool down period, the engine will be stopped.

Servo
Configures the servo profile for autostart maintain modes.

Gain
Controls the aggressiveness of the maintain servo modes.

Delay 10mS
Controls how quickly the maintain servo mode responds to changes in level.

Transducer
This submenu configures the transducer type and set points.

Type
Selects between Level and Pressure CANplus Configurator.

Range
Selects appropriate range for the transducer type.

High Set Point
For Empty and Maintain Out modes, sets the level that begins and autostart cycle. For Fill and Maintain In modes, sets the level that ends the cycle.

Maintain Point
Sets the target point for maintain modes.
Low Set Point
For Empty and Maintain Out modes, sets the level that ends an autostart cycle. For Fill and Maintain In modes, sets the level that begins a cycle.

Dead Band
Sets the amount of change from the target point required to alter the engine speed.

Starter
This submenu configures starter control options for autostart.

Restart Attempts
Selects the number of times to attempt restart.

Restart Delay Sec
Selects the number of seconds to wait before attempting a restart.

Start on Sec
Selects the maximum number of seconds the starter can be engaged.

SETTINGS MENU
This submenu allows the user to configure CANplus hardware.

Governor
Selects between Elect (electronically governed) and Mech (mechanically governed) engines modes. For mechanically governed engines, the CANplus I/O Board functions as an ECU, broadcasting engine parameters such as oil pressure and temperature on the CANbus.

Note: Switching governor modes requires cycling power before calibrating the RPM. The CANplus Configurator must be used to configure mechanical engine parameters.

CP750 CAN Add
Selects the address used by the display to communicate with the CANplus I/O Board. The default I/O Board address is 128.

Note: Engine data is always transmitted using address 0 in mechanically governed mode.

⚠️ WARNING
Incorrectly configuring the CP750 CAN Address prevents the display from receiving I/O Board data for the display menus and can result in data collisions on the CANbus.
Calibrate RPM

Calibrates the tachometer input for mechanically governed engines to allow the CANplus I/O Board to measure the engine speed. This signal may be provided by an alternator frequency tap, proximity switch. An optional amplifier/divider can be added for use with a magnetic pickup.

*Note:* Calibrate RPM is only available on mechanically governed engines. The RPM must be calibrated for automatic start/stop operation to function.

Crank the engine and measure the engine RPM with a hand-held tachometer. Select Calibrate RPM and enter the digits of the measured RPM using the buttons corresponding to the digits of the RPM. Button 1 adjusts the first digit of the RPM. Button 2 adjusts the second digit, button 3 the third digit, and button 4 the fourth digit. The RPM is entered using button 5 .

When the calibration is complete, the LEDs will begin a blinking sequence. The power must be cycled to continue configuration or operation.

**Aux Output**

Selects the Aux Output function and provides a one amp low side switch.

- **Running** The output is active when the engine RPM exceeds 500 RPM.
- **AS Armed** The output is active when the Key switch is in the Autostart position and the engine has not stopped due to a fault.
- **At Speed** The output is active when the engine is at or above the operating RPM.
- **Prestart** The output is prestart alarm activated 10 seconds before the engine automatically starts.

*Note:* The Aux Output is available on a connector in the I/O Board only. Changing the prestart alarm time requires using the LOFA Configurator.

**Alarm Settings**

Configures the set points for the transducer alarm messages. The alarm is transmitted as SPN 1083 with FMI 1 for a low alarm and FMI 0 for a high alarm.

- **Low Level ft**
  Sets the transducer low level alarm set point.

- **High Level ft**
  Sets the transducer high level alarm set point.

**TELEMETRY MENU**

This menu allows configuring the optional telemetry system.

**Telem J1939 Address**

Defines the address the telemetry module is using for CANbus communications.

*Note:* The display will be unable to communicate with the telemetry module if this address is incorrect.

**Modbus Address**

Selects the Modbus slave address the telemetry module will use for Modbus communications.
Status
Displays telemetry and modem status information retrieved from the telemetry module:

- **MODEM TYPE**: Identifies the modem type
- **CELL REG**: Identifies cell modem registration
- **CELL STATE**: Indicates cell state and signal strength
- **GPS**: Indicates GPS status
- **RTC**: Indicates number of days since real time clock cellular update
- **MODBUS SSLT**: Indicates Modbus slave status
- **HDW STATUS**: Indicates various hardware status items
- **SOFTWARE VER**: Indicates the version of software in the Messenger

**DB VIEWER**
The Database Viewer displays and decodes all data monitored by the display. This diagnostic tool allows viewing data not normally displayed.

The list can be scrolled using buttons 1 and 2 and closed by pressing button 5.

*Note: The Database Viewer is always in English regardless of language selected.*

**PREFERRED SCREEN STORE**
The display automatically stores the current screen as the preferred screen after a delay of approximately 15 seconds. The display will use the last stored screen on the next power up.

*Note: Selecting Restore Defaults restores the Analog Gauge Pages and default gauges.*

**POP-UP MESSAGES AND ALERTS**

**Service Required**
Users can set up to 16 service timers in hours in the Configuration menu (refer to “Adjusting the Service Timers” on page 51). The Service Required pop-up is displayed at power up when one or more service timers has expired. Pressing any button removes the pop-up. If no button is pressed, the pop-up closes in approximately five seconds.

**Data Communications Failure**
The Data Communications Failure pop-up icon flashes if the display does not detect data. The warning disappears...
and normal operation resumes once data is detected.

**Note:** Incorrectly configuring the Engine Source address will result in no data available for display.

### Data Not Available

Gauges and the Db Viewer will display `---` if the desired data is not available. The display value returns to normal when parameter data is received.

### ADJUSTING LIGHTING AND CONTRAST

Pressing button 5 (the right-hand button) when there is no menu bar opens the lighting and contrast menu bar. The display has a number of backlighting levels, allowing the display to be read in the dark. The level is adjusted by pressing button 1 to decrease, or button 2 to increase, illumination. Contrast is adjusted in the same manner using buttons 3 and 4.

**Note:** The display adjusts the contrast with ambient temperature. Manual contrast adjustments are only necessary with extreme climate change.

The menu is exited by pressing button 5. The lighting and contrast settings are retained after the unit is powered off.

**Note:** If the contrast has been adjusted poorly, the factory setting is restored by pressing buttons 1 thru 4 simultaneously. This action does not change other user-configured settings.

### INDICATORS

#### Auto Standby LED (Green)

A solidly illuminated Auto Standby LED indicates the Key switch is in the AUTO START position and the system is ready to start.

#### Preheat LED (Amber)

A solidly illuminated Preheat LED indicates the engine is preheating. When the LED extinguishes, the preheat period is complete and the engine may be cranked.

**Note:** The CANplus display only reports when the ECU is requesting preheat. Cold starting aids may not be installed in all engine configurations.

#### Engine Stop LED (Red)

A solidly illuminated Engine Stop LED indicates the ECU has stopped the engine due to a fault.

**Note:** ECU programming determines the response to warnings and failures. Typically the ECU can be programmed to shut down, derate, or run to failure. The CANplus display only displays ECU reported conditions.

#### Warning LED (Amber)

A solidly illuminated Warning LED indicates a warning reported by the ECU.

**Note:** The Warning LED is not used in Mechanical Governor mode.
DATA PARAMETERS MONITORED

This table lists the engine and transmission parameters that are monitored via the CANbus. The parameters can be displayed by the user-configurable gauge pages or the single analog gauge. DB is an abbreviation for the internal database which stores all data transmitted from the engine/transmission. The complete database can be accessed on the display via the Db Viewer in the Configuration menu.

</table>
Proper welding procedures are required to avoid damage to electronic controls, sensors and associated components. The component should be removed for welding if possible.

The following procedure must be followed if the component must be welded while installed on equipment with electronic controls. This procedure will minimize the risk of component damage.

**WARNING**

Do not ground the welder to electrical components such as the control ground or sensors. Improper grounding can cause damage to electrical components. Clamp the ground cable from the welder to the component being welded. Place the clamp as close as possible to the weld to reduce the possibility of damage.

1. Stop the engine. Turn the Key switch to the OFF position.
2. Disconnect the negative (-) battery cable from the battery.
3. Open any installed Battery Disconnect switch.
4. Unplug the control system if possible.
5. Connect the welding ground cable as close as possible to the area to be welded.
6. Protect the wiring harness from welding debris and splatter.
7. Use standard welding methods to weld the materials.
This Page Intentionally Left Blank
Section 3 - Operation

PUMP SET UP

1. Disconnect the pump from the tow vehicle by turning the tongue jack clockwise to raise the tongue from the hitch. Disconnect all safety chains, surge brake cables and the trailer wiring harness. Block the wheels to prevent the unit from rolling.

2. Lower the rear leveling jacks from the travel position. Turn the jack handles clockwise until the leveling feet are in firm contact with the ground. Adjust the jacks until the pump is as level as possible.

3. Attach fittings to both the intake and outlet openings of the pump, making sure they match the fittings on the hoses. Make sure a gasket/seal is in place between the pump volute and the flange on the fitting being attached. Tighten all hardware completely to ensure an airtight seal. Threaded fittings require the use of pipe thread sealant.

4. Attach a rigid hose/pipe to the intake (suction) side of the pump. For best performance, the suction hose/piping should be at least as large as the pump flange, never smaller. The pump should be at the highest point of the hose/piping. All suction piping and fittings should be checked for any foreign material (rocks, bolts, wire, etc.) and also any sharp burrs that could disrupt the flow.

5. Attach a rigid intake screen or strainer to the end of the suction hose before placing it in the liquid. This will prevent large items or excessive trash from entering the pump housing. The screen must have enough

Note: If using quick connect couplings, make sure the rubber seal is present before attaching. Lubricate the rubber seal with grease to ensure an airtight seal.

⚠️ CAUTION

The suction and discharge pipe/hose material should be compatible with the liquid being pumped. If a hose is used on the suction line, it should be of the reinforced type to prevent collapse under suction lift.

⚠️ DANGER

IF A MANUAL SHUTOFF VALVE IS INSTALLED IN THE DISCHARGE LINE, IT MUST NOT BE LEFT CLOSED DURING OPERATION. A CLOSED MANUAL SHUTOFF VALVE WILL CAUSE OVERHEATING AND POSSIBLE EXPLOSIVE RUPTURE OF THE PUMP CASING. PERSONNEL COULD BE SERIOUSLY INJURED.
openings to equal 28 sq. in. (181 sq. cm) or more (6 in. pump). The screen should be rigid enough to prevent collapse when flow is reduced due to clogging.

A = Suction Lift: The distance between the centerline of the pump impeller and the surface of the liquid being pumped.

B = Vertical Discharge Head: Vertical distance from the centerline of the pump inlet to the centerline of the highest point of discharge.

C = Total Dynamic Head (TDH): Suction lift plus vertical discharge plus friction loss.

Note: To calculate PSI, divide TDH in feet by 2.31.

Example: \( \frac{TDH (35 \text{ ft})}{2.31} = 15.15 \text{ PSI} \)

Figure 11 - Suction Specifications

6. Place the intake hose into the liquid to be pumped. The submergence of the suction pipe into the liquid should be at least four to five times the pipe diameter. If this is not possible, provide a baffle or a floating board. This is to prevent any vortex action from allowing air into the pipe/hose. For best performance, a bell mouth fitting is recommended. Recommended pipe submergences for various flows as well as recommended bell diameters are shown in the table below. The table data is referenced from ANSI/HI 9.8-1998.

</tbody>
</table>
7. Attach a flexible hose/pipe to the outlet (discharge) side of the pump.

**Note:** If using quick connect couplings, make sure the rubber seal is present before attaching. Lubricate the rubber seal with grease to ensure an airtight seal.

8. Use a concentric taper on the discharge side to increase discharge pipe/hose diameters. All valving and additional fittings should be the same size as the discharge main-line. The discharge size should be adequate to maintain reasonable velocities and reduce friction losses.

9. Check the intake and outlet hoses for sharp bends or kinks that may restrict pump flow. The intake hose should slope upwards toward the pump to avoid development of air pockets in the hose, which may lead to pump cavitation. Keep the hoses as straight as possible.

10. The pump is self-priming, but should never be operated unless there is liquid in the pump casing. The pump casing needs to be half filled with liquid in order to prime. Remove the cover from the top of the pump volute and fill the pump casing with water. The pump will not prime when dry.

**WARNING**

Extended operation of a dry pump will destroy the seal assembly. Make sure the pump casing is half filled with liquid when priming.

**Note:** The casing will only fill to the bottom of the intake fitting, not to the top of the volute. Replace the cover and hand tighten the clamp screws.

**WARNING**

Never open the priming cover on a pump that is hot or that has been operated recently. Extreme pressure may have built up inside the pump volute. Opening the priming cover could cause serious injury.

**Figure 12 - Remove Priming Cover**

**PUMP PRE-USE CHECKPOINTS**

Before using the pump, be sure to check the following:

- Place the pump as close as possible to the liquid being pumped, keeping the number of hose sections and couplings to a minimum. The pump should be the highest point between the intake and outlet section of the suction hoses.
- Make sure the ground is firm and as level as possible. Block the wheels on the trailer to keep it from moving.
- Check the pump discharge area; make sure discharge will not erode the material under the pump or damage any nearby structures.
- Ensure all hose couplings are of the same size and type.
• All hoses/piping should be supported, braced and lined up square before connecting to the pump flanges. A flexible fitting is recommended on both suction and discharge to eliminate misalignment loads or stresses being transmitted to the pump.

**Note:** Flexible pipe couplings must be restrained so as not to transmit any strain to the pump flanges when expanding or contracting under pressure. Unrestrained expansion fittings can transmit enormous forces to the pump flanges.

**WARNING**

The pump is designed to handle water and/or other liquids containing some slurries and other entrained solids up to 3 inches in diameter. It MUST NOT be used to pump volatile, corrosive or flammable materials that can damage the pump, cause pump failure or result in explosion. Serious personal injury could result.

**PRESTART CHECKLIST**

- Ensure all fasteners at gasketed surfaces are properly tightened.
- Ensure belts and couplings (shaft) are properly adjusted, aligned, and guards are in place.
- Ensure all thrust blocks and supports are adequate.
- Ensure all electrical connections and electrical equipment are installed by a qualified and licensed electrical contractor.
- Never operate electric motors or pump equipment without all protective covers, screens and guards properly in place.
- Ensure pump drain is closed.
- Check the valves for proper position. If connecting to a system that has a discharge gate valve, start with the valve closed. The speed of opening depends upon the size and length of the discharge pipe and capacity of the pump. The valve should not be more than .25 in. (6.35 mm) open until the line is filled. This will reduce the possibility of a water hammer of shock if filling is too rapid.
- Ensure all hose couplings, covers and plugs are tight.
- Check the oil levels in the sight glasses on the connection between the engine flywheel and pump volute. The oil level should be in the middle of each sight glass.
- Check lip seal vent for leakage. The bearing oil and mechanical seal oil are each sealed by a shaft lip seal, and a vent to atmosphere exists between these two lip seals to indicate oil leaks from either cavity. If either the bearing oil or mechanical seal oil lip seals leak, oil will leak from the vent.

![Figure 13 - Lip Seals](image)

- Check the engine oil level, coolant level and fuel level.
- Make sure the battery is connected.
- Make sure the Emergency Stop switch is pulled out (deactivated).

The unit is now ready for use.
STARTING THE UNIT

1. Turn the Key switch to the right RUN position. A startup screen will appear. After the startup screen is cleared, the display will show readings on its virtual gauges. Once the gauges appear, crank the engine by turning and holding the Key switch in the START position until the engine starts. Refer to page 15 for details.

2. Allow the engine to run until it reaches a constant speed. Once it is running smoothly, the engine speed can be adjusted with the Speed Control switch (rabbit icon / turtle icon), located to the left of the Key switch on the control panel.
   a. Press and release the Rabbit icon to increase the speed.
   b. Press and hold the Rabbit icon to accelerate to full speed in a few seconds.
   c. Press and release the Turtle icon to decrease engine speed. (Press and hold for continuous deceleration.)

3. The pump should self prime and begin to discharge liquid within minutes. The pump may not prime immediately because the suction line must first fill with liquid. If the pump fails to prime within five minutes, stop it and check the suction line for leaks.

4. Use the Speed Control switch (rabbit icon / turtle icon) to adjust the pump flow. Several factors can influence pump output:
   - The temperature, viscosity, and amount of entrapped solids in the liquid being moved.
   - The length, diameter, and number of bends of the intake and outlet hoses.
   - The total suction height (lift) of the pump.
   - The altitude above sea level where the pump is operating.

   **WARNING**
   Never adjust the pump flow by attaching a valve to the intake or outlet side of the pump. Restricting the flow in this way can cause the pump to overheat, creating extreme pressure inside the pump volute. Explosion of the pump volute and serious personal injury may result.

5. As the pump operates, avoid sucking an air/liquid mixture into the intake side of the pump as this may cause the pump to cavitate, causing damage to the pump impeller. The intake hose must be kept 4-5 times the hose diameter (4-5 x 6 in. = 24-30 in. [4-5 x 15 cm = 61-76 cm]) below the surface of the liquid being pumped.

   **CAUTION**
   Do not exceed the maximum recommended operating pressure for the pump.
Use the following flow charts for approximate flow rates.

**Figure 14 - 4 Inch Pump Flow Rate Chart**
TORSIONAL VIBRATION

Torsional vibration is a periodic, reversing twist in a torque transmitting member such as a shaft. This twisting is superimposed upon the rotation of the shaft. Any rotational system has at least one torsional natural frequency, the frequency at which the shaft will twist back and forth if a torque is instantaneously applied then released. Internal combustion engines deliver torque in a periodic or pulsing manner and consequently are very effective exciters of torsional vibration. If an engine/pump set operates too near a critical speed, severe damage to the pump, engine or related components can result. This is not indicative of a defect in any of the components; rather it is a characteristic of any rotational system. For more information about torsional vibration, contact Generac Mobile Products Technical Service.

LIQUID TEMPERATURE AND OVERHEATING

The maximum liquid temperature for this pump is 160°F (71°C). Do not apply it at a higher operating temperature. Overheating can occur if the pump is operated with the valves in the suction and/or discharge lines closed. Operating against closed valves could bring the liquid to a boil, build pressure, and cause the pump to rupture or explode. If overheating occurs, stop the pump and allow it to cool before servicing it. Refill the pump casing with cool liquid. As a safeguard against rupture or explosion due to heat, this pump is equipped with a pressure relief valve that will open if vapor pressure within the pump casing reaches a critical point. APPROACH ANY OVERHEATED PUMP CAUTIOUSLY. It is recommended that the pressure relief valve assembly be replaced at each overhaul, or any time the pump casing overheats and activates the valve.
PUMP VACUUM CHECK

With the pump inoperative, install a vacuum gauge in the system. Make sure the pump is at least half filled with liquid. Block the suction line and start the pump. At operating speed, the pump should pull a vacuum of 20 in. (67.7 kPa) of mercury or more. If it does not, check for air leaks at the suction piping gaskets.

BEARING TEMPERATURE CHECK

Bearings normally run at higher than ambient temperatures because of heat generated by friction. Temperatures up to 160°F (71°C) are considered normal for bearings, and they can operate safely to at least 180°F (82°C). Measure the bearing temperature with a contact-type thermometer.

SHUTTING DOWN THE UNIT

1. Allow the engine to idle briefly before switching the Key switch to the OFF position.

   NOTICE

   Do not use the Emergency Stop switch unless absolutely necessary. Stopping the pump suddenly may cause shock waves to be transmitted back to the pump volute, causing pump damage. To activate the Emergency Stop switch, push the red button in. To deactivate the switch, pull the button out.

2. The unit is adequately prepared for outside storage. Refer to “Storage” on page 58 for extended storage suggestions.

   NOTICE

   If the unit is to remain idle during below freezing conditions, drain the pump to prevent damage from freezing. Also, clean out any solids by flushing with a hose.

EMERGENCY STOP SWITCH

The unit is equipped with one Emergency Stop switch. For location of the Emergency Stop switch, refer to “Component Locations” on page 10. The red button is clearly labeled “EMERGENCY STOP.”

Activate the Emergency Stop switch by pushing the button in until it locks down. This opens the fuel circuit, shutting down the engine. The switch will remain locked until it is pulled out.

AUTOMATIC SHUTDOWN

The unit is equipped with a low oil pressure and a high temperature automatic shutdown system. This system will automatically shut off the fuel supply to stop the engine if oil pressure drops too low or the engine exceeds normal operating temperature. Return the Key switch to the OFF position to reset the controller; restart the engine after you have determined the cause of the shutdown. Refer to “Engine Fault Shutdown Troubleshooting” on page 62 for more information.
TOWING THE UNIT

1. Use the jack to raise or lower the trailer onto the hitch of the towing vehicle. Lock the hitch coupling and attach the safety chains or cables to the vehicle. Raise the jack foot completely.

2. Connect any trailer wiring to the tow vehicle. Check for proper operation of the directional and brake lights.

3. Make sure all doors are properly latched.

4. Check for proper inflation of the trailer tires. For maximum tire pressures, refer to “Specifications” on page 7.

5. Check the wheel lugs. Tighten or replace any that are loose or missing. If a tire has been removed for axle service or replaced, tighten the lugs in the order shown to the following specifications:
   a. Start all lug nuts by hand.
   b. First pass tighten to 20-25 ft-lbs (27-33 Nm).
   c. Second pass tighten to 50-60 ft-lbs (67-81 Nm).
   d. Third pass tighten to 90-120 ft-lbs (122-162 Nm).

   Note: After the first road use, re-torque the lug nuts in sequence.

6. Maximum recommended speed for highway towing is 45 mph (72 km/h). Recommended off-road towing speed is not to exceed 10 mph (16 km/h) or less, depending on terrain.

LIFTING THE UNIT

Remove the suction and discharge piping from the pump prior to moving. Make sure the equipment being used to lift the unit is in good condition and has sufficient capacity.

Note: Refer to “Specifications” on page 7 for approximate weights.

Always remain aware of the position of other people and objects around you as you move the unit.

A central lift point is located on the top of the unit. Attach any slings, chains or hooks directly to the lift point. Use the forklift pockets with care. Approach the unit as perpendicular as possible to avoid any damage to the unit. Make sure any obstructions are clear of the forklift tines before lifting.

⚠️ WARNING
Use lifting and moving equipment that is in good condition and that has adequate capacity to prevent personal injury or equipment damage. When lifting the pump end with chains or cables, position them so the load is balanced and so pump damage will not occur. Suction and discharge hoses and piping must be removed from the pump before lifting.
Section 4 - Maintenance

Normal maintenance service and replacement of parts are the responsibility of the owner/operator and, as such, are not considered defects in materials or workmanship within the terms of the warranty.

Poorly maintained equipment can become a safety hazard. In order for the equipment to operate safely and properly over a long period of time, periodic maintenance and occasional repairs are necessary. **NEVER** perform even routine service (oil/filter changes, cleaning, etc.) unless the Key switch is turned to OFF and the negative (-) cable on the battery is disconnected. Attach a “DO NOT START” sign to the control panel. This will notify everyone that the unit is being serviced and will reduce the chance of someone inadvertently trying to start the unit. Make sure engine and pump components are adequately cooled before attempting any service or maintenance work.

For detailed engine maintenance procedures, refer to the engine operator’s manual, which was supplied with the unit when it was shipped from the factory.

⚠️ **WARNING**
Before attempting to service the unit, read this manual carefully. Also review all tags and labels/decals provided on the equipment. Operating and maintenance personnel should have a good understanding of all aspects of this unit and the pumping conditions. Failure of operating personnel to be familiar with all aspects of pump operation outlined in this manual could contribute to equipment damage, bodily injury or possible death.

Before servicing:

1. Verify that the Key switch is turned to OFF and the negative (-) cable on the battery is disconnected.
2. If the pump or components are hot, allow adequate cooling prior to servicing the unit.
3. Close the suction and discharge valves.
4. Vent the pump slowly and drain completely.

⚠️ **CAUTION**
Do not allow compressed air to pressurize the pump or vent-off compressed air through the pump, as this may damage the pump and cause serious personal injury.

⚠️ **WARNING**
If this unit is used to handle any hazardous materials that can cause injury or illness, take precautions by wearing approved protective clothing and use appropriate safety equipment.

When servicing the unit, use only components provided by the OEM or Generac Mobile Products. Any use of non-authorized parts could result in sub-standard performance, damage to equipment and possible injury to personnel. Use of unauthorized parts will also void the warranty.

Refer to the troubleshooting section on page 61 to help diagnose operational or performance problems. Only disassemble the unit components required to remedy the problem condition. Select a clean suitable location for any required maintenance, and note that all work must be performed by qualified personnel.

**DAILY WALK AROUND INSPECTION**

Look for conditions that could hinder performance or safety, such as (but not limited to) oil/coolant/fuel leakage, blocked vents, loose/missing hardware and electrical connections.

Visually inspect the engine fan belt for cracks, fraying, stretching and that the belt is properly seated in pulley grooves. Replace the belt according to the manufacturer’s recommendations.
NOTICE
Failure to perform a daily inspection may result in serious damage to the prime mover.

GENERAL MAINTENANCE

NOTICE
Refer to the original equipment manufacturer’s operating manual for a complete list of maintenance requirements. Failure to comply with the procedures as described in the engine operator manual will nullify the warranty, decrease performance and cause equipment damage or premature equipment failure. Maintenance records may be required to complete a warranty request.

Use the schedule in the following table as a guide for regular maintenance intervals.

Table 2 - Basic Maintenance Schedule

</tbody>
</table>

* Change the engine oil and oil filter after the initial 50 hours of operation, then at the appropriate interval thereafter. Refer to engine manual for engine oil recommendations.
Maintenance

Checking the Engine Oil
Low engine oil and overfilling lead to engine damage. The oil level may only be checked with the engine in a horizontal position and switched off. If the engine is warm, switch off the engine and check the oil level after five minutes. If the engine is cold, you can check it immediately.

⚠️ WARNING
Be careful of hot lubricating oil. Scalding can occur. Do not pull out the dipstick while the engine is running.

1. Pull out the dipstick and wipe off with a lint-free, clean cloth.
2. Insert the dipstick into the engine again as far as it will go.
3. Pull out the dipstick again and read the oil level. The oil level must always be between the MIN and MAX marks. Top up to the MAX mark if necessary.

Checking the Pump Sight Level Gauges
Check that oil is visible in the sight glass for the mechanical seal and bearing frame. (It is recommended that the sight glasses be checked daily.) If no oil is visible, oil will need to be added.

Adding Oil:
1. Shut down the unit.
2. Remove the air breather in the bearing frame and add oil until halfway up the sight glass (gauge).
3. Remove the air breather in the mechanical seal and add oil until halfway up the sight glass (gauge).

Note: Be careful to keep dirt and moisture out when adding oil. DO NOT OVERFILL.

Draining Oil:
1. Shut down the unit.
2. Place a suitable containers under the mechanical seal and bearing frame drain plugs.
3. Remove the mechanical seal and bearing frame drain plugs.
4. Drain the oil completely.
5. Reinstall the seal and bearing drain plugs.
6. Follow the instructions above for adding oil.

Changing the Engine Oil
1. Warm up the engine (oil temperature greater than 176°F [80°C]).
2. Ensure the engine is in a level position.
3. Turn the engine off.
4. Place a collecting receptacle underneath the oil drain tube located on the side of the unit.
5. Open the drain valve and drain the oil into the receptacle.
6. After the oil has drained completely, close the drain valve.
7. Remove the engine oil fill cap and add the recommended amount and type of oil. Refer to the engine manual for specifications.

8. Warm up the engine (oil temperature greater than 176°F [80°C]).

9. Ensure the engine is level and check the oil level. Refer to “Checking the Engine Oil” on page 49.

**Changing the Oil Filter**

*Note: The filter cartridge should never be pre-filled. There is a danger of dirt contamination.*

1. Remove the clamps if twist protection mounted (optional).

2. Loosen and unscrew the filter with a filter tool. Refer to the engine manual for more information.

3. Collect the draining engine oil.

4. Clean the sealing surface of the filter support with a lint-free, clean cloth.

5. Oil the gasket of the new filter cartridge lightly.

6. Screw on the new filter by hand until the gasket is touching and then torque to 11-13 ft-lbs (15-17 Nm).

7. Fasten the twist protection clamps, if present.

**JACK MAINTENANCE**

The following procedures should be performed at least annually.

**Side-Wind Models**

- The internal gearing and bushings of the jack must be kept lubricated. Apply a small amount of automotive grease to the internal gearing by removing the jack cover, or if equipped, use a needle nose applicator or standard grease gun on the lubrication point found on the side of the jack near the crank. Rotate the jack handle to distribute the grease evenly.

- A lightweight oil must be applied to the handle unit at both sides of the tube.

- If equipped, the axle bolt and nut assembly of the caster wheel must also be lubricated with the same lightweight oil.

**Top-Wind Models**

- Apply a lightweight oil to the screw stem.

![Figure 19 - Lubrication Points](image)

**TRAILER WHEEL BEARING LUBRICATION**

Some trailers are equipped with a grease zerk fitting to allow lubrication of the wheel bearings without the need to
disassemble the axle hub. To lubricate the axle bearings, remove the small rubber plug on the grease cap, attach a standard grease gun fitting to the grease zerk fitting and pump grease into the fitting until new grease is visible around the nozzle of the grease gun. Use only a high quality grease made specifically for lubrication of wheel bearings. Wipe any excess grease from the hub with a clean cloth and replace the rubber plug when finished. The minimum recommended lubrication is every 12 months or 12,000 miles (19,312 km). More frequent lubrication may be required under extremely dusty or damp operating conditions.

**RESETTING THE DIGITAL CONTROLLER**

1. Hold the far right button to enter the Configuration menu.
2. Enter password 4444.
3. Enter Display.
4. Select service interval to change/reset.

![Configuration menu](image)

The top level Configuration menu and its six choices.

**Adjusting the Service Timers**

Pressing button 4 allows adjusting the selected service timer. Refer to “Service Timers” on page 14 for more information.

**SERVICING THE PUMP**

The pump has a removable coverplate that provides quick access to the pump’s interior. Adjustments can be made between the clearance of the impeller and the external wearplate without disturbing the seal assembly and impeller back clearance.

The suction check valve can be easily replaced through the front cover without removing the pipework. The rotating assembly can also be removed without dismantling the pump or disturbing the piping.

35. Fill plate cover
36. Clamp bar
Bearing and Shaft Assembly

1. Heat the pump end bearing to 213°F (101°C) maximum on an induction bearing heater, using a Tempilstik to check the bearing temperature.

2. Slide the heated bearing onto the pump shaft, making sure the bearing is seated against the shaft shoulder.

3. Heat the drive end bearing to 213°F (101°C) maximum on an induction bearing heater, using a Tempilstik to check the bearing temperature.

4. Slide the heated bearing onto the pump shaft, making sure the bearing is seated against the shaft shoulder and the bearing snap ring is toward the drive end of the shaft.

5. Snap the retaining ring into the groove in the shaft.

Bearing Frame Assembly

1. Rotate the bearing frame upon its end. Place the bearing frame directly over an opening larger than the shaft diameter.

2. Install the shaft/bearing assembly into the bearing frame.

Note: No shimming is required for bearings. Bearing endplay is 0-.010 inches (0-.254 mm).

3. Apply a thin film of aviation sealant to the outside diameter of the drive end lip seal and press it into the engine bracket. Refer to Figure 24 on page 55.

4. Slide the gasket over the shaft/bearing assembly until it rests on the bearing frame.
5. Slide the engine bracket over the shaft/bearing assembly and secure it to the frame with six screws and lockwashers.

![Figure 23 - Bearing Frame Assembly](image1.png)

5. Shaft assembly  
6. Retaining ring  
7. Gasket  
8. Engine bracket  
9. Lip seal - drive end  
10. Oil sight gauge (2)

6. Apply a thin film of aviation sealant to the outside diameter of the pump end lip seal. Install the lip seals in the pump end of the frame using a lip seal installation tool. (Lip seals to be installed with springs.)

![Figure 24 - Installing the Lip Seals](image2.png)

7. Refer to *Figure 23* for installation of the breathers, plugs and sight gauges.
**Sleeve Installation**

8. Ensure the shaft has no burrs before installing the sleeve. Remove burrs, if necessary.

9. Heat the sleeve to approximately 400°F (204°C) for about 10 minutes.

10. Slide the sleeve onto the shaft quickly, until it bottoms on the step on the shaft.

**Rotating Assembly**

1. Before installing the impeller, wash the impeller threads with shop solvent. Be sure the threads in the impeller and on the shaft are completely clean and free of all burrs or other debris.

2. Before installing the impeller, several measurements need to be taken to determine if any shims are needed to achieve the proper backvane clearance. Using an adjustable square, measure the distance from the end of the sleeve to the surface of the backplate. Compare this dimension with a measurement taken from the impeller hub to the backvane surface to determine how many shims are needed to achieve the proper backvane clearance.
3. Rotate the shaft by hand to install the impeller, paying close attention not to cross-thread. Support the impeller if necessary. Be certain that the drive end of back side of the impeller is perpendicular and lined up to the shaft threads.

4. When the impeller bottoms on the sleeve, the backvane clearance should be checked with feeler gauges to obtain 0.022-.038 in. (.558-.965 mm) backvane clearance. Adjust the impeller shims if necessary. Once the backvane clearance is within specification a shaft wrench can be used to tighten the shaft into the impeller.

5. The shaft wrench is designed to be used on the drive end of the frame shaft. Tighten the impeller by rotating the shaft counter-clockwise and then back clockwise rapidly until the wrench hits the workbench or other solid surface. This should be done two to three times to be sure the impeller is seated against the sleeve. **DO NOT OVERTIGHTEN THE IMPELLER.**

6. After the impeller is installed, install the lockscrew (with impeller washer) with a permanent thread locker, such as Loctite® 262 or equivalent. Tighten to the torque listed in the chart.

**Table 3 - Impeller Lockscrew Torque Values**

<table>
<thead>
<tr>
<th>Size</th>
<th>Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>.50-13UNC</td>
<td>40 ft-lb (4 inch pump)</td>
</tr>
<tr>
<td>.62-11UNC</td>
<td>90 ft-lb (6 inch pump)</td>
</tr>
</tbody>
</table>

**Impeller Installation**

In all models, the distance between the tip of the impeller blades and the surface of the wear plate must be between .020-.028 in. (.508-.711 mm). To achieve this value, move the wear plate away from the impeller by turning the adjustment bushings, once you have calculated "C" as described below.
C = (B-A+R)
A = Distance between impeller blades and machined surface of the casing.
B = Distance between wear plate and machined surface of the cover plate.
R = Distance between impeller blades and wear plate (.020-.028 in. (.508-.711 mm).

- Tighten the adjustment bushings to move the cover away from the casing
- Be sure all four adjustment bushings are adjusted evenly.
- After adjusting, be sure the shaft and impeller rotate freely.

**Note:** Turning the adjustment bushing one flat (1/6 turn) equals .015 in. (.381 mm) of axial distance.

---

**STORAGE**

The unit is adequately prepared for outside storage prior to shipment. Use the following list of additional suggestions for extended storage.

**Extended Storage Preparation**

1. Disconnect the battery cables.
2. Store the unit off the ground so no water will accumulate around the equipment.
3. Protect the unit from blowing sand and dirt.
4. Stack no other items on top of the pump/equipment.
5. Protect the unit from the entry of any animals.
6. Periodically rotate shaft to lubricate bearings and protect bearings from brinelling.
7. Protect unit with approved drying agents (Silica Gel).
8. Ensure all bare metal areas are coated with a rust preventative.
9. Inspect unit every four weeks and replace drying agents (Silica Gel) as required, or a minimum of every six months.
10. Keep an inspection record showing dates of inspection with any maintenance performed and condition of drying agents (Silica Gel).
11. Before use ensure that all rust protection has been removed. Also, remove any foreign material that may have accumulated during storage.
12. Before use remove all drying agents (Silica Gel).
13. Drain all water from the main pump piping, including the suction line and discharge line. Remove the volute drain plug and vent plug to empty the pump casing.
14. Verify correct oil level in the engine and seal oil reservoir. Add oil as necessary.
15. Add grease to the main pump bearing frame fittings. Three to six strokes at each fitting with a hand grease gun should be sufficient.
16. Jog the main pump motor for 10 to 15 seconds. Replace all plugs removed for draining.

WINTER STORAGE
Occasional motor starts once every month are recommended. Run the unit until it reaches operating temperature. This will help to replace and maintain a lubricating film on the bearings and operating parts.

Restart Preparation
In installations where winter shutdown and storage is the normal situation, it is recommended that lubricating oil and seal barrier oil be drained and replaced to correct levels before the beginning of each new season.

- Add fresh grease to the main bearing frame and vacuum pump pedestal fittings.
- Check all gasketed flanges, especially those on the suction side of the pump, for bolt tightness to eliminate the effect of air leaks on the priming time.

Troubleshooting
CONTROL SYSTEM TROUBLESHOOTING

### Diagnostic Trouble Codes (DTS)

CANbus Diagnostic Trouble Codes are a pair of numbers; the Suspect Parameter Number (SPN) and Failure Mode Identifier (FMI). The SPN indicates the faulting subsystem and the FMI identifies the type of failure.

#### SPN Codes

Standard SPN codes are defined by SAE J1939-71. Not all standard codes are provided by ECUs. Manufacturers may add additional SPN codes beyond the codes identified in J1939-71. Contact a Deutz dealer or Generac Mobile Products Technical Service for more information.

**Table 4 - Typical SPN Codes**

<tr>
<td></td>
<td>Engine source address incorrect</td>
<td>Change engine address in Configuration</td>
</tr>
<tr>
<td></td>
<td>Display address incorrect</td>
<td>Change display address to 40 (default)</td>
</tr>
<tr>
<td></td>
<td>Display configuration problem</td>
<td>Reset display using Restore Defaults</td>
</tr>
<tr>
<td></td>
<td>CANbus failure</td>
<td>Check CANbus (Refer to Testing CANbus)</td>
</tr>
<tr>
<td></td>
<td>ECU not sending data</td>
<td>Repair or replace ECU</td>
</tr>
<tr>
<td>Engine will not crank</td>
<td>Fuel level/pressure low (SPN 524057)</td>
<td>Check fuel level&lt;br&gt;Check if fuel supply line is loose&lt;br&gt;Prime fuel system: Turn key to Start position. Let pump run for 10-15 seconds. (May need to repeat.)</td>
</tr>
</tbody>
</table>
FMI Codes
FMI codes are defined by SAE J1939-71. Refer to ECU documentation for correct interpretation of FMI codes for a specific SPN.

### Table 5 - FMI Codes

<table>
<thead>
<tr>
<th>FMI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Data valid but above normal operational range</td>
</tr>
<tr>
<td>1</td>
<td>Data valid but below normal operational range</td>
</tr>
<tr>
<td>2</td>
<td>Data erratic, intermittent or incorrect</td>
</tr>
<tr>
<td>3</td>
<td>Voltage above normal or shorted high</td>
</tr>
<tr>
<td>4</td>
<td>Voltage below normal or shorted low</td>
</tr>
<tr>
<td>5</td>
<td>Current below normal or open circuit</td>
</tr>
<tr>
<td>6</td>
<td>Current above normal or grounded circuit</td>
</tr>
<tr>
<td>7</td>
<td>Mechanical system not responding properly</td>
</tr>
<tr>
<td>8</td>
<td>Abnormal frequency, pulse width or period</td>
</tr>
<tr>
<td>9</td>
<td>Abnormal update rate</td>
</tr>
<tr>
<td>10</td>
<td>Abnormal rate of change</td>
</tr>
<tr>
<td>11</td>
<td>Failure mode not identifiable</td>
</tr>
<tr>
<td>12</td>
<td>Bad intelligent device or component</td>
</tr>
<tr>
<td>13</td>
<td>Out of calibration</td>
</tr>
<tr>
<td>14</td>
<td>Special instructions</td>
</tr>
<tr>
<td>15</td>
<td>Data valid but above normal operational range (least severe)</td>
</tr>
<tr>
<td>16</td>
<td>Data valid but above normal operational range (moderately severe)</td>
</tr>
<tr>
<td>17</td>
<td>Data valid but below normal operational range (least severe)</td>
</tr>
<tr>
<td>18</td>
<td>Data valid but below normal operational range (moderately severe)</td>
</tr>
<tr>
<td>19</td>
<td>Received network data in error</td>
</tr>
<tr>
<td>20-30</td>
<td>Reserved for future assignment</td>
</tr>
<tr>
<td>31</td>
<td>Not available or condition exists</td>
</tr>
</tbody>
</table>

Section 7 - Options & Accessories

REMOTE/AUTO STARTING
The unit can be configured to start automatically by adding dry-contact closure float level switches. Contact the Generac Mobile Products Technical Service Department at 1-800-926-9768 for more information on this option.
